

Earth Friendly Plastic. The Future is Now!

CORN CARDS

- Non crude oil based alternative
- The first greenhouse-gas-neutral polymer
- Compatible with existing commercial recycling programs including industrial composting

Corn is a domestic, renewable resource grown right here in the United States, reducing our dependence on foreign oil and labor. The innovative technology used to create this printable substrate is also home grown, making Corn Cards a product good for the environment and the economy.

Corn Cards as opposed to traditional PVC card can be industrially incinerated and industrially composted leaving no harmful toxins as with PVC cards. Corn Cards return to the earth calmly and safely. So we have a product that is a domestic renewable resource.

Corn Cards can, and should be integrated into your marketing to let your customers know that your business is doing its part in protecting our planet.
